

Tables of contents

Introduction

Chapter I: Energy metabolism of microorganisms

1 Energy sources and trophic types

1-1 Phototrophs

1-2 Chemotrophs

1-3 Autotrophs

1-4 Heterotrophs

1-5 Mixotrophs

2 Final electron acceptor and types of respiration

2-1 Aerobic respiration

2-2 Anaerobic respiration

2-3 Fermentation

3 Enzymes and chemical reactions

3-1 Enzyme families

a Oxidoreductases

b Lyases

c Isomerases

d Ligases

3-2 Kinetics of substrate degradation

3-3 Influence of concentration

3-4 Enzymatic inhibition

a Competitive inhibition

b Non-competitive inhibition

c Uncompetitive inhibition

d Inactivation: irreversible inhibition

e Substrate inhibition

Chapter II: Exchange with the environment

1 General characteristics

2 Transport mechanisms

2-1 Simple diffusion (passive transport)

2-2 Facilitated diffusion (passive transport)

- a Diffusion through pores
- b Diffusion via permeases or transporters
- 2-3 Active transport
 - a Primary active transport
 - b Secondary active transport
- 2-4 Group translocation
- 2-5 Endocytosis
- 2-6 Exocytosis

Chapter III: Carbohydrate catabolism

- 1 Generalities
- 2 Energetic metabolism and consequences
- 3 Energy production mechanism
 - 3-1 Phototrophy
- 4 Respiration types
 - 4-1 Respiration
 - a Glycolysis
 - b Krebs cycle (Tricarboxylic acid cycle / Citric acid cycle)
 - c Electron transport chain (Respiratory chain)
 - d Oxidative phosphorylation
 - 4-2 Fermentation
 - a Glucose fermentation
 - b Alcoholic fermentation
 - c Lactic fermentation
 - d Mixed acid and butylene-glycol fermentation
 - e Butyric fermentation
 - f Propionic fermentation
 - g Oxidative fermentation
 - 4-3 Alternative glycolysis pathways
 - a Entner–Doudoroff (ED) pathway
 - b Pentose phosphate pathway
 - c Phosphoketolase pathway (heterolactic fermentation)
 - 4-4 Fate of pyruvate
 - a Aerobic respiration

b Anaerobic fermentation

4-5 Study and significance of selected metabolic types

a Aerobic lithotrophs

b Anaerobic lithotrophs

c Aerobic and anaerobic organotrophs

Chapter IV: Catabolism of other organic compounds

1 Lipid catabolism

1-1 Hydrolysis of lipids

1-2 Metabolism of glycerol

1-3 β -oxidation of fatty acids

1-4 Entry into central metabolism

1-5 Energy yield

1-6 Special considerations

2 Protein catabolism

2-1 Proteolysis

2-2 Catabolism of free amino acids

a Deamination

b Decarboxylation

3 Urea catabolism

4 Ethanol catabolism

5 Catabolism of other alcohols

6 Specificity according to sugar types

6-1 Galactose metabolism

6-2 Citrate metabolism

Chapter V: Anabolism and biomass production

1 Amino acids production

1-1 Microorganisms used

1-2 Metabolic pathways for production

1-3 Fermentation conditions

1-4 Extraction and purification

1-5 Key biochemical insights

2 Lipid production

2-1 Types of microbial lipids

2-2 Oleaginous microorganisms

2-3 Metabolic pathway of lipid synthesis

2-4 Conditions affecting lipid accumulation

2-5 Applications of microbial lipids

3 Nucleotides production

3-1 Used microorganisms

3-2 Biosynthetic pathways

3-3 Industrial production process

4 Antibiotics production

4-1 Microorganisms producing antibiotics

4-2 Types of antibiotics

4-3 Biosynthesis of antibiotics

4-4 Regulation of antibiotic production

4-5 Applications

5 Hormones production

5-1 Microorganisms used

5-2 Biochemical basis of hormone production

5-3 Applications

6 Toxins production

6-1 Biological roles and ecological context

6-2 Biochemical basis

6-3 Beneficial uses and biotechnology

6-4 Safety and ethical considerations

7 Exopolysaccharides production

7-1 Types of EPS in LAB

7-2 Biosynthesis of EPS

7-3 Functions and applications

8 Enzymes production

8-1 Types of microbial enzymes

8-2 Microbial sources

8-3 Enzyme production pathways

8-4 Fermentation strategies

8-5 Applications

References
